

## Double Slider Tilt Window – Installation Instructions

- Do not cut the centre banding.
- Place window into the opening making sure that it is not forced into too small an opening.
- Unlock the window and slide both sashes to the centre.
- Locate side jamb covers (snap-in cover with weather stripping at both ends of the window) and remove them by inserting a sharp chisel and prying them out.
- Shim side frame 4" from the top and bottom at approximately 16" on centre until the frame is square, plumb and level.
- Screw #8 X 3" screws through frame pockets where jamb covers were removed at shim locations. *Do not over-tighten, as this will distort the frame.*
- Snap jamb covers back into frame.
- Close the sashes and lock the window.
- Shim frame top and bottom at the midpoint until frame is level. There should be the same gap between the sash and frame at the midpoint as at either end. This ensures a proper seal.
- Cut centre banding and pull it out.
- Tilt innermost sash inward.
- Remove balance cover on top and bottom of the interior track.
- In the very centre of the top and bottom track, screw #8 X 3" screws through the frame. *Do not put screws in path of the pivot shoe as this would hinder the operation of the window.*
- *Important: Seal screw heads in the bottom track with "GE 2800 Siliglaze" or equivalent.*
- Tilt the sash back into the frame and check to see that the gap between the frame and sashes remains constant over the entire width of the window.
- Lightly pack insulation into the gap between the frame and rough opening making sure that all voids are filled. If urethane foams are used, extreme caution must be exercised. Expansion of foam may cause the frame to distort.
- Seal the window inside and out.
- Trim to suit.
